

ST ANDREWS COLLEGE

Grassports and St Andrews College collaborated to produce an amazing sporting facility for the students. The project involved the construction of a sport facility on a suspended slab above a carpark. The scope of works included the installation of a drainage system, shockpad, and playing surfaces for netball and other sports. Special attention was given to ensuring the stability and functionality of the suspended slab while addressing unique challenges such as drainage, structural integrity, and equipment installation.

This highly successful project was completed with great client satisfaction, particularly praising the effective handling of drainage issues and the innovative solutions for installing netball posts. The appreciation of the seamless integration of the sports facility with the existing carpark structure and high level of quality of the playing surfaces was extraordinary. .
